

Code Comparison

The first major difference between the two versions is the **navigation structure**. In my manual version, the placement of the `<a>` and `<li>` elements is different from the AI-assisted version. I wrote my manual version based on my own understanding of HTML, while the AI generated the navigation using a more conventional HTML structure. I prefer the AI-assisted version because it has a clearer and more appropriate list structure, with each `<li>` containing its corresponding link.

The second difference is the **page structure and use of semantic elements**. My manual version uses several `<div>` elements, while the AI-assisted version uses semantic elements such as `<main>` and `<section>`. I used `<div>` because I was more familiar with it as a general-purpose container, whereas the AI suggested more semantic HTML elements. I prefer the AI-assisted version because semantic elements make the structure and purpose of different parts of the webpage clearer and can improve accessibility and maintainability.

The third difference is the **contact form**. The AI-assisted version connects labels to inputs using `for` and `id` attributes, uses `name` attributes, and uses `<textarea>` for the message, while my manual version uses simpler input elements. I created my form using the basic HTML elements I knew, while the AI provided a more complete form structure. I prefer the AI-assisted version because the labels are properly associated with their inputs, and `<textarea>` is more appropriate for entering a longer message.

The fourth difference is **image accessibility**. Both versions use an `alt` attribute, but the AI-assisted version provides more descriptive alternative text and also specifies an image width. I used a short description because I understood the basic purpose of the `alt` attribute, while the AI generated a more descriptive version. I prefer the AI-assisted version because descriptive alternative text provides users who cannot see the image with more useful information about its content.

The fifth difference is **content organization**. The AI-assisted version organizes additional information into separate semantic sections containing headings and lists, while my manual version keeps the homepage relatively simple. I think this difference occurred because I focused mainly on meeting the basic requirements, while the AI generated additional content and organized it into separate sections. I prefer the AI-assisted version because it provides more useful information and demonstrates a clearer organization of the page content.
